

Why should you have an allergy test performed?

Many people have diagnosable allergies

A lot of people all around the world suffer from allergies. According to The World Allergy Organization, it is estimated that around 30-40% of the world's population suffers from at least one allergic condition.

Impossible to Know Without Testing

It is impossible to know exactly which symptom is causing a specific allergic reaction without an official allergy test. Testing is positively necessary for a proper diagnosis of the substance that causes the adverse reactions.

Proper Diagnosis is Necessary for Treatment

Once you have been properly diagnosed, then treatment can be planned and executed. You may need to start taking a particular medication to treat those allergies or, if medication is not available, you have to do what you can to avoid your particular allergy triggers.

Many Allergies Develop in Adulthood

While it is true that many children have allergies right from the beginning, there are many individuals who develop allergies later on in life. You may think that since you did not have allergies as a child your current symptoms cannot be allergic reactions but that may not be the case.

LIFE THREATENING REACTIONS

One major allergic reaction is Anaphylaxis which affects many different parts of the body at the same time and can be life-threatening. It is necessary to prevent a fatal reaction like this one. Knowing exactly what you are allergic to and how to avoid it can quite literally save your life.

There are endless allergens that could be to blame for your symptoms but the ones listed are far more likely.

Partnering with your physician to provide **Professional Allergy Services.**

Contact your provider to get more information about **Allergy Testing** and the **Allergy Treatment Program.**

Are you suffering from any of these symptoms? **If the answer is YES, then you may be suffering from Allergic Disease.**

- Severe Head Aches
- Sore Throat

What Is Causing Your Allergies?

Pet & Animal Dander

Feathers

Roaches & Dust Mites

Trees, Flowers, Grass & More

Molds & Fungi

You Deserve To Live A Quality Life, No Matter What Your Age!

The fact is, as we age our risk of developing complications from Allergic Disease goes up by nearly 50%. Some complications that could potentially be life threatening are; pneumonia or upper respiratory infections that can lead to more severe complications; severe itching that can lead to Staph infections, or the development of Asthma, and the list continues.

By providing you with our state-of-the-art Allergy Testing, we can help you avoid all of these and live an allergy free, happy life! It only takes a minimum of a couple of months for you to start feeling great again. It takes anywhere from 1 to 3 years to complete the treatment and become free from the burden of your allergies. It is a very small price to pay for complete relief.

Allergy testing and treatment will allow you to get back to doing the things that you once loved like gardening, hiking, yard work, housework, owning pets again, etc.

You can get tested today, it only takes 20 minutes of your time!

Allergy Statistics

- Asthma and allergic diseases, such as allergic rhinitis (hay fever), food allergy, and eczema, are common for all age groups in the United States. Asthma affects more than 24 million people in the U.S., including more than 6 million children.
- Allergies are the 6th leading cause of chronic illness in the U.S. with an annual cost in excess of \$18 billion. More than 50 million Americans suffer from allergies each year.
- Allergic rhinitis, often called hay fever, is a common condition that causes symptoms such as sneezing, stuffy nose, runny nose, watery eyes and itching of the nose, eyes or the roof of the mouth.
- Allergic rhinitis can be seasonal or perennial.
- Symptoms of seasonal allergic rhinitis occur in spring, summer and/or early fall. They are usually caused by allergic sensitivity to pollens from trees, grasses or weeds, or to airborne mold spores.
- People with perennial allergic rhinitis experience symptoms year-round. Perennial allergic rhinitis is generally caused by sensitivity to house dust mites, animal dander, cockroaches and/or mold spores. Underlying or hidden food allergies rarely cause perennial nasal symptoms.
- Once diagnosed, allergic rhinitis treatment options are: avoidance, eliminating or decreasing your exposure to the irritants or allergens that trigger your symptoms, medication and immunotherapy (allergy shots).
- Immunotherapy (allergy shots) helps reduce hay fever symptoms in about 85% of people with allergic rhinitis.

Allergy Fast Fact:

Some of the Environmental Allergens discussed above can travel up to 100 miles. Avoidance can be impossible depending on what you are allergic to. Get tested and find out your results today.

It could change your life!
